

CONTAINER STORAGE SYSTEM AND METHOD

ABSTRACT OF THE DISCLOSURE

5 A container system for storing food or other products is provided comprising a
bottom wall and a peripheral wall defining a storage area for receiving the goods, and a
display window extending from the outer surface of the peripheral wall. The display
window defines a gap for receiving at least one display token. The display token
corresponds to information relating to the goods or products stored in the container, and
the display token is visible through the wall of the display window.
